Homework 2: Cryptanalysis

yugtmath

This homework is due **Thursday, September 21** at **6 p.m.** and counts for 5% of your course grade. Late submissions will be penalized by 10% plus an additional 10% every 5 hours until received. Late work will not be accepted after 19.5 hours past the deadline. If you have a conflict due to travel, interviews, etc., please plan accordingly and turn in your homework early.

We encourage you to discuss the problems and your general approach with other students in the class. However, the answers you turn in must be your own original work, and you are bound by the Honor Code. Submit your solution on Canvas following the instructions at the end of this document.

To solve these problems, you will probably want to write some short programs; submit them with your answers. We recommend Python, but you may use any common language or numerical package.

1. Here is a Python dictionary of the relative frequency of letters in English text:

```
{ "A": .08167, "B": .01492, "C": .02782, "D": .04253, "E": .12702, "F": .02228,
  "G": .02015, "H": .06094, "I": .06996, "J": .00153, "K": .00772, "L": .04025,
  "M": .02406, "N": .06749, "O": .07507, "P": .01929, "Q": .00095, "R": .05987,
  "S": .06327, "T": .09056, "U": .02758, "V": .00978, "W": .02360, "X": .00150,
  "Y": .01974, "Z": .00074 }
```

   Here is some plaintext:

```

```

   The *population variance* of a finite population X of size N and mean μ is given by

$$\mathrm{Var}(X) = \frac{1}{N}\sum_{i=1}^{N}(x_i - \mu)^2.$$

(a) What is the population variance of the relative letter frequencies in English text?

(b) What is the population variance of the relative letter frequencies in the given plaintext?

(c) For each of the following keys — `yz`, `xyz`, `wxyz`, `vwxyz`, `uvwxyz` — encrypt the plaintext with a Vigenère cipher and the given key, then calculate and report the population variance of the relative letter frequencies in the resulting ciphertext. Describe and briefly explain the trend in this sequence of variances.

(d) Viewing a Vigenère key of length k as a collection of k independent Caesar ciphers, calculate the mean of the frequency variances of the ciphertext for each one. (E.g., for key `yz`, calculate the frequency variance of the even numbered ciphertext characters and the frequency variance of the odd numbered ciphertext characters. Then take their mean.) Report the result for each key in part (c). Is the mean variance like those observed in part (b)? Part (c)? Briefly explain.

(e) Consider the ciphertext that was produced with key `uvwxyz`. In part (d), you calculated the mean of six variances for this key. Revisit that ciphertext, and calculate the mean of the frequency variances that arise if you had assumed that the key had length 2, 3, 4, and 5. Does this suggest a variant to the Kasiski attack? (Don't say no!) Briefly explain.

2. Here is some ciphertext that was produced with a Vigenère cipher:

```

```

Assume that encrypting with the key letter `A` results in no change, `B` results in an increment by one place in the alphabet, `C` results in an increment by two places, and so on.

What is the key? (Show your work.)

3. Briefly, what is "snakeoil cryptography"? How does it relate to the exercise above?

Submission Template

Please submit three files to Canvas: `P1.txt`, `P2.txt`, and `P3.txt`. `P1.txt` and `P2.txt` will contain both the code and solutions used for the respective problem. If you used the same code for both problems, please repeat the code in both documents (it makes it easier for us to grade!). **Make sure your files are `.txt` files** and not `.rtf` files, and check to make sure they display properly on Canvas. Also be sure to comment your code with clear explanations and to cite any references used.

Filename: P1.txt
